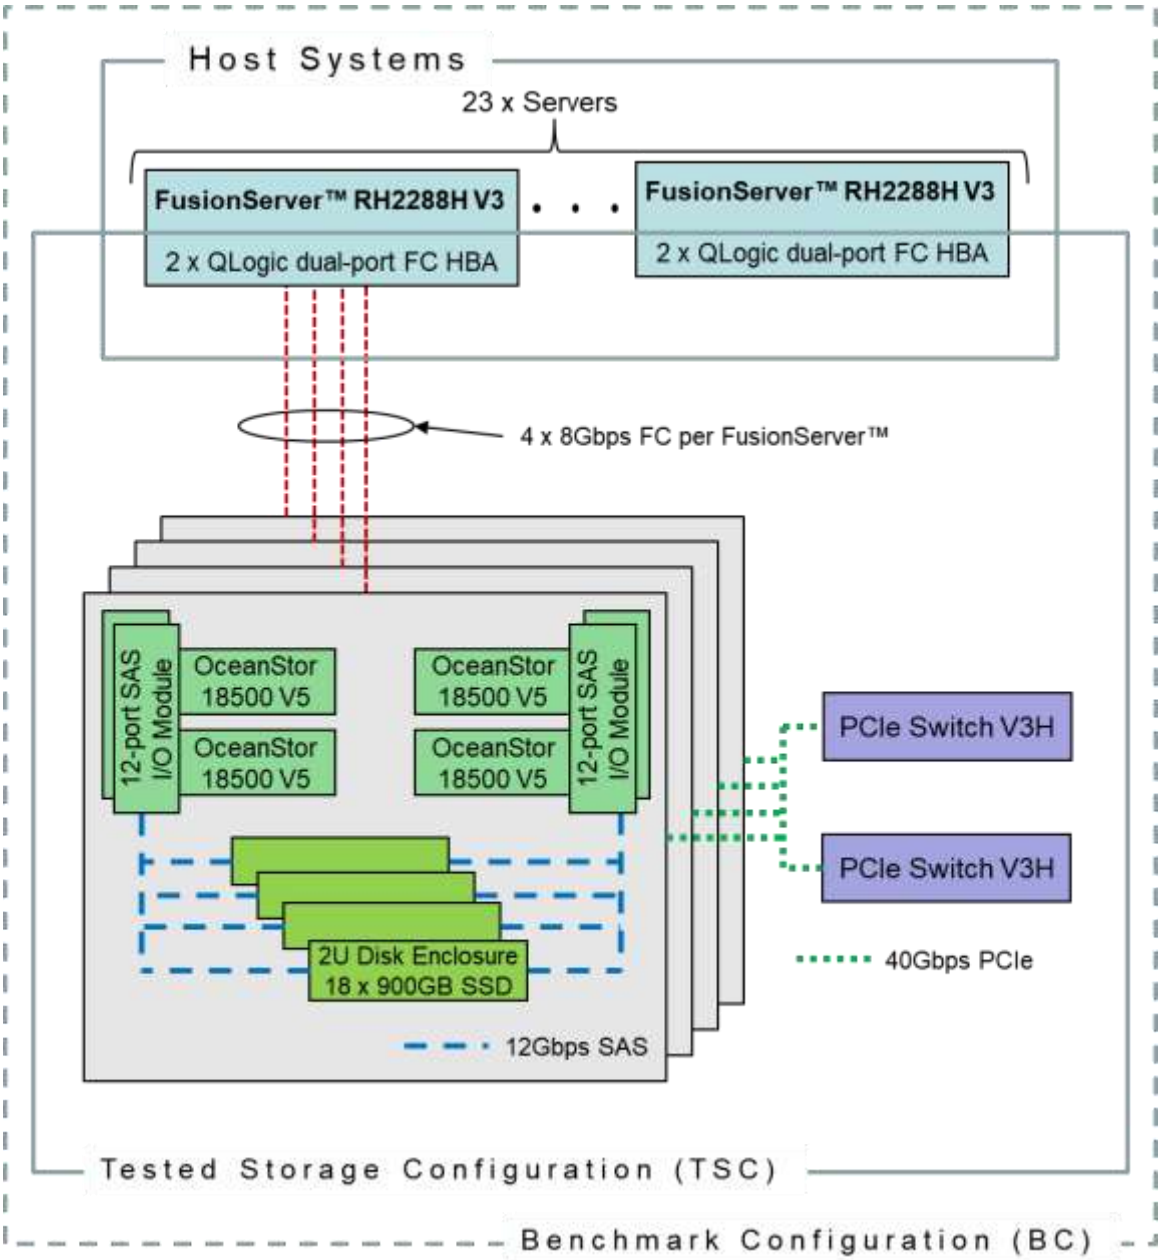
CONFIGURATION INFORMATION

Benchmark Configuration and Tested Storage Configuration

The following diagram illustrates the Benchmark Configuration (BC), including the Tested Storage Configuration (TSC) and the Host System(s).



Storage Network Configuration

The Tested Storage Configuration (TSC) involved an external storage subsystem made of 16 Huawei OceanStor 18500 V5, driven by 23 host systems (Huawei FusionServer RH2288H V3). The OceanStor controllers were grouped in sets of four, forming four OceanStor Engines. Each FusionServer host system connected one-to-one to each OceanStor Engine. That connection was established via a port from one of the two dual-port Fibre Chanel HBAs on the FusionServer; and a port from one of the eight 4-port Smart I/O Modules on the OceanStor Engine, leaving nine of these ports inactive in each Engine. These Fibre Chanel paths operated at 8Gbps.

Host System and Tested Storage Configuration Components

The following table lists the components of the Host System(s) and the Tested Storage Configuration (TSC).

Host Systems
23 x Huawei FusionServer™ RH2288H V3 2 x Intel® Xeon® E5-2667 v4 (3.2 GHz, 8 Cores, 25 MB L3) 128 GB Main Memory Red Hat Enterprise Linux 7.1
Priced Storage Configuration
46 x QLogic dual-ported QLE2562 FC HBA
16 x OceanStor 18500 V5 Active-Active Controllers, each with: 512 GB cache (8192 GB total) 2 x 4-port 8Gbps Smart I/O Modules 16 x 12-port 12Gbps SAS I/O Modules 16 x 2U disk enclosures, each with: 18 x 900 GB SSDs (288 total) 2 x PCIe 16-port switches 1 x Service Processor 1 x 8-port KVM

Differences Between Tested and Priced Storage Configurations

There were no differences between the Tested Storage Configuration and the Priced Storage Configuration.

- **SPC1_PERSIST_1_0_Raw_Results.xlsx**
- **SPC1_PERSIST_2_0_Raw_Results.xlsx**

Data Persistence Test Execution

The Data Persistence Test was executed using the following sequence of steps:

- The PERSIST_1_0 Test Phase was executed to completion.
- The Benchmark Configuration was taken through an orderly shutdown process and powered off.
- The Benchmark Configuration was powered on and taken through an orderly startup process.
- The PERSIST_2_0 Test Phase was executed to completion.

Data Persistence Test Results

Data Persistence Test Phase: Persist1	
Total Number of Logical Blocks Written	296,864,268
Total Number of Logical Blocks Verified	149,656,998
Total Number of Logical Blocks that Failed Verification	147,207,270
Time Duration for Writing Test Logical Blocks (sec.)	0
Size in bytes of each Logical Block	300
Number of Failed I/O Requests in the process of the Test	8,192

Committed Data Persistence Implementation

The persistency of committed data is implemented at two levels. At the disk level, data loss is prevented through the use of RAID 10 arrays. At the controller level, all caches are mirrored across controllers, where write requests are only completed once the local cache has been successfully mirrored in another controller's cache. In addition, cache content is protected from a loss of power by flushing the cache content to permanent flash memory, as soon as a power loss is detected. The flushing action is powered by a battery backup located in each controller.

APPENDIX C: TUNING PARAMETERS AND OPTIONS

The following scripts, listed below, were used to set tuning parameters and options:

- ***aio-max-nr.sh*** to change the maximum number of AIO operations to 1048576
- ***nr_requests.sh*** to change nr_requests from 128 to 1024 on each Host System for each device
- ***scheduler.sh*** to change the I/O scheduler from cfq to noop on each Host System, which will result in all incoming I/O requests inserted into a simple, unordered FIFO queue

The scripts described above are included in the Supporting Files (see Appendix A) and listed below.

Step 3 - Create Volumes on the Host Systems

The ***mkvolume.sh*** shell script, listed below, is invoked on the master Host Systems to perform the following actions:

- Create 64 physical volumes
- Create a volume group for the 64 physical volumes
- Create 18 Logical Volumes for ASU-1
- Create 18 Logical Volumes for ASU-2
- Create 2 Logical Volumes for ASU-3

The shell script described above is included in the Supporting Files (see Appendix A) and listed below.

APPENDIX E: CONFIGURATION INVENTORY

An inventory of the Tested Storage Configuration was collected during the execution the script *full_run.sh.* It generated the following log file:

- ***profile1_volume.log*** List of configured volumes before the INIT Phase.
- ***profile1_storage.log*** List of configured storage before the INIT Phase.
- ***Profile2_volume.log*** List of configured volumes after TSC restart.
- ***Profile2_storage.log*** List of configured storage after TSC restart.

The above log files are included in the Supporting Files (see Appendix A).

APPENDIX F: WORKLOAD GENERATOR

The ASUs accessed by the SPC-1 workload generator, are defined using the script ***slave_asu.asu***.

The phases of the benchmark are executed using the script ***full_run.sh***. The script pauses at the end of the PERSIST_1 test phase. Once the TSC has been restarted, the PERSIST_2 test phase is executed by pressing ENTER from the console where the script has been invoked.

The above scripts are included in the Supporting Files (see Appendix A) and listed below.
